## METEOROLOGY

A moderately strong El Niño weather pattern was likely the main reason for the series of storms that moved across Arizona during the January 17 - 22 period. At this time of year the jet stream (area of strongest winds aloft) statistically tracks across the central Pacific and as it approaches the west coast moves northeast toward the Pacific Northwest. But during this series of events, due to the El Niño, the jet stream was located much farther south - crossing California and Arizona.

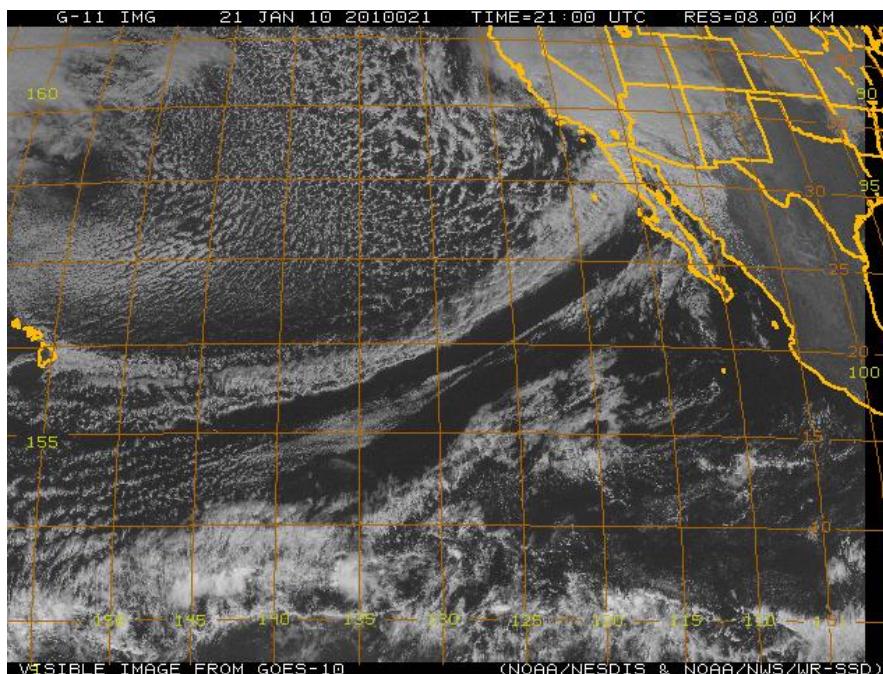

This was important as storms typically follow the jet stream; so they too tracked much further south, resulting in a long fetch of moisture moving across the Pacific into California and Arizona.

The first storm of consequence took place Tuesday, January 19 and resulted in an average of about an inch of rain across Maricopa County. Runoff from this storm was minimal due to rather low antecedent moisture in the soils.

The next rain event developed Wednesday night. At least two fast moving weather disturbances moved through central Arizona, with the event lasting through Thursday night. The heaviest rain during this period was ahead and with a cold front that marched across central Arizona Thursday.

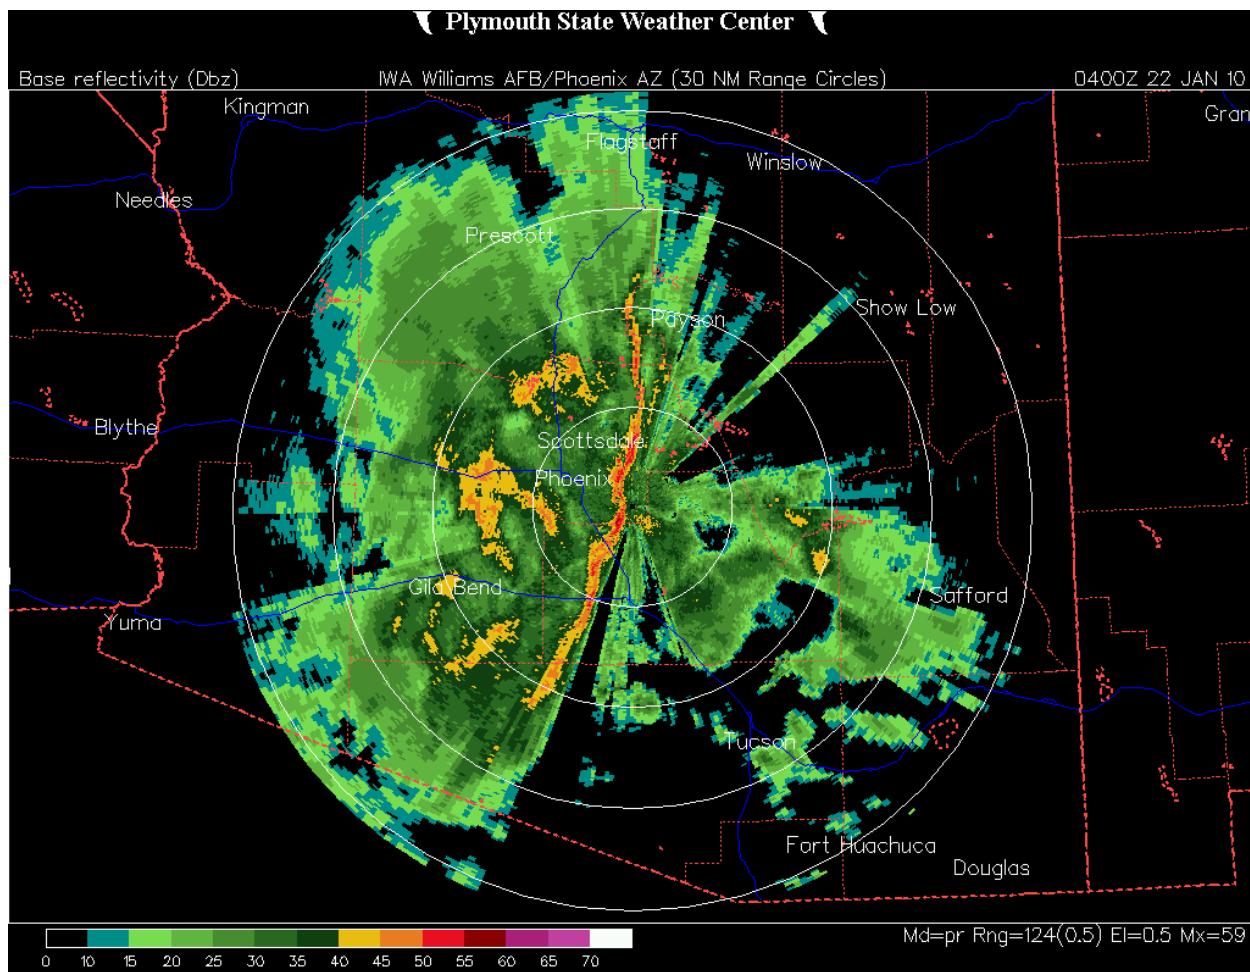

Due to the combination of a wet atmosphere, strong dynamics, and ground that had become close to saturated due to the previous storm, heavy rain during this period quickly resulted in runoff/flooding. As a side note there were also strong gusty winds late Thursday - locally to over 60 mph.

The bulk of the storm moved off to the east during the night Thursday. There were lingering showers Friday, mainly due to residual moisture and daytime heating, but no additional or new flooding of consequence.

**FIGURE 1**

GOES-10 visible satellite photo of the eastern Pacific on Jan. 21, 2010 at 21:00 UTC (2:00 PM MST). Note the connection to moisture all the way down to Hawaii, and the cumulus clouds behind the front indicating very cold air.

**Figure 2** above shows a line of severe thunderstorms associated with the passage of a cold front at approximately 9:00 PM MST on 01/21/2010. Near this time, the Durango Complex weather station recorded a peak wind gust of 32 mph and barometric pressure of 995 millibars (29.39 in/Hg).

**Table I - Peak Wind Gusts Recorded by Maricopa County Weather Stations on the evening of Jan. 21, 2010**

Station Name	Location	Peak Gust (mph)
Bartlett Lake	NE Maricopa County	44
Carefree Ranch	NE Maricopa County	35
Durango Complex	Central Maricopa County	32
Gila Bend Landfill	SW Maricopa County	37
Horsethief Basin	Southern Yavapai County	63
Lake Pleasant	North-Central Maricopa Co.	43
Mobile	South-Central Maricopa Co.	37
Rackensack Canyon	NE Maricopa County	72
South Mtn. Park	Central Maricopa County	31

## PRECIPITATION

### Summary Statistics:

Total FCDMC Automated Rain Gages Installed: 306

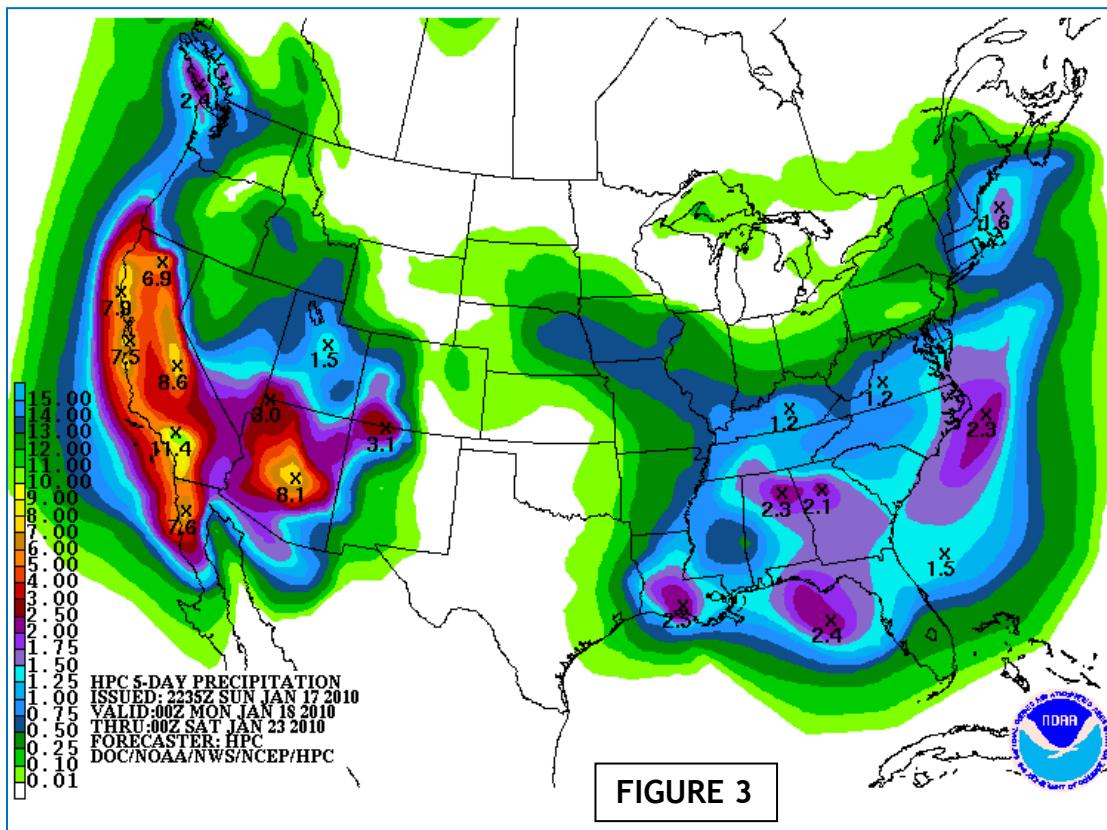

Number of Rain Gages which failed to operate during the storms: 7

Overall Percent Operational Automated Rain Gages for the Month: 98.8%

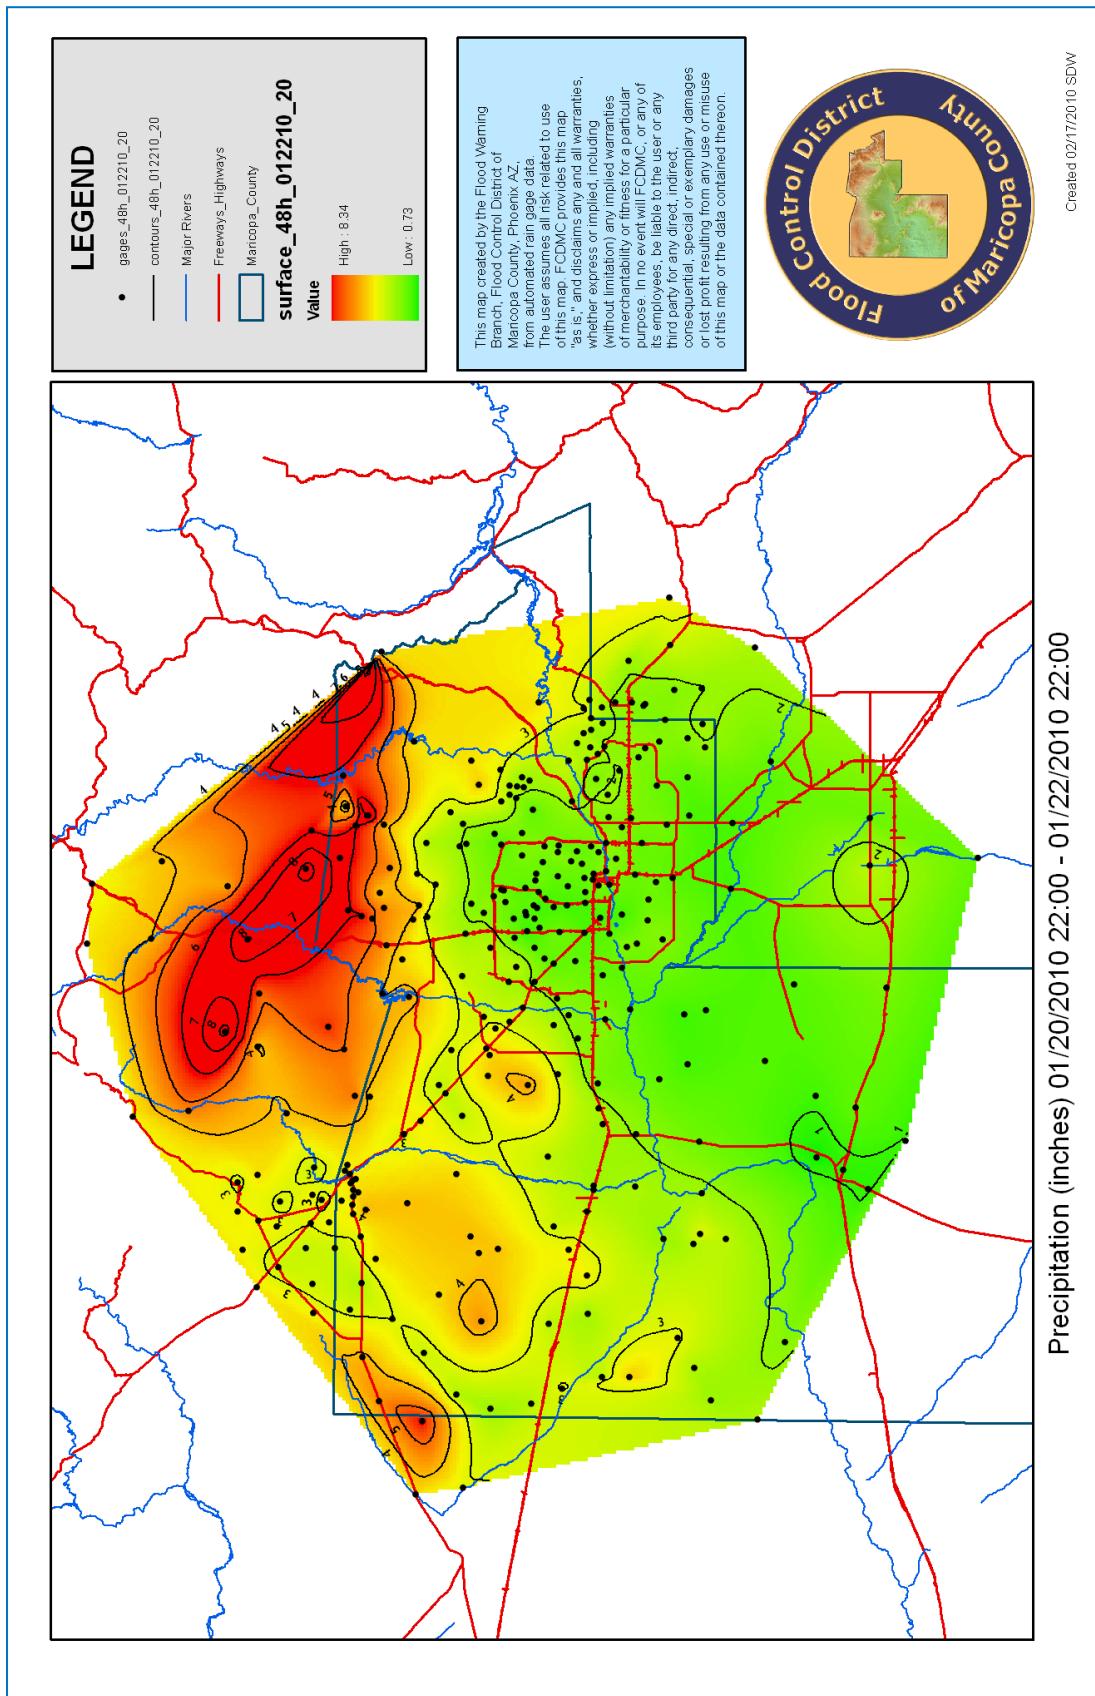

For the month of January 2010,

Number of gages recording more than:

10 inches of precipitation -----	4
8 inches -----	10
7 inches -----	14
6 inches -----	23
5 inches -----	61
4 inches -----	108
3 inches -----	198

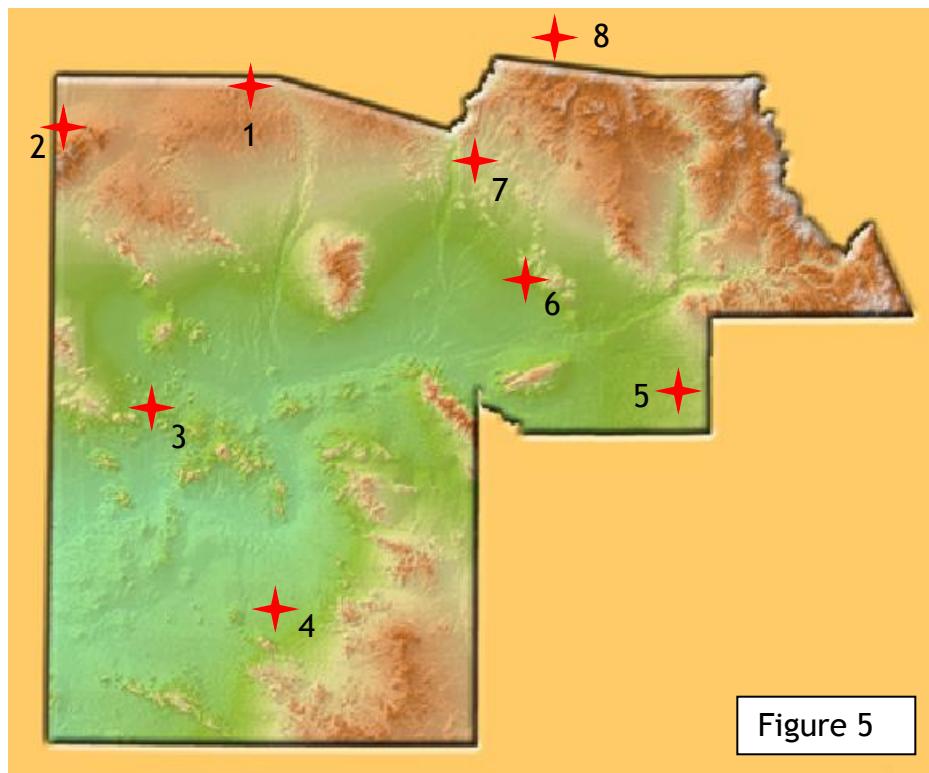

This 5-day rainfall forecast was issued by the National Weather Service's Hydrometeorological Prediction Center on January 17<sup>th</sup> at 3:35 PM MST for the period Sunday Jan. 17<sup>th</sup> 5:00 PM MST through Friday Jan. 22<sup>nd</sup> 5:00 PM MST. It was reasonably accurate, and alerted many emergency responders and the media as to the severity of expected rainfall in the coming week.

**Figure 4** above was created with ESRI ARCMAP® using 48-hour rainfall totals from FCDMC ALERT gages and the “nearest neighbor” method to interpolate amounts between the gages. The amounts illustrate the effects of orographic lifting in this area of the State where storms moving generally west to east will drop larger amounts of precipitation as they move upslope.

## RAINFALL STATISTICS AROUND THE COUNTY

- 1) Vulture Mine Rd. 5260
- 2) Gladden 5170
- 3) Saddleback FRS 5110
- 4) Sand Tank Wash 6940
- 5) Queen Cr. Rd. 6610
- 6) Dreamy Draw Dam 4800
- 7) New River Dam 5610
- 8) Cooks Mesa 5640

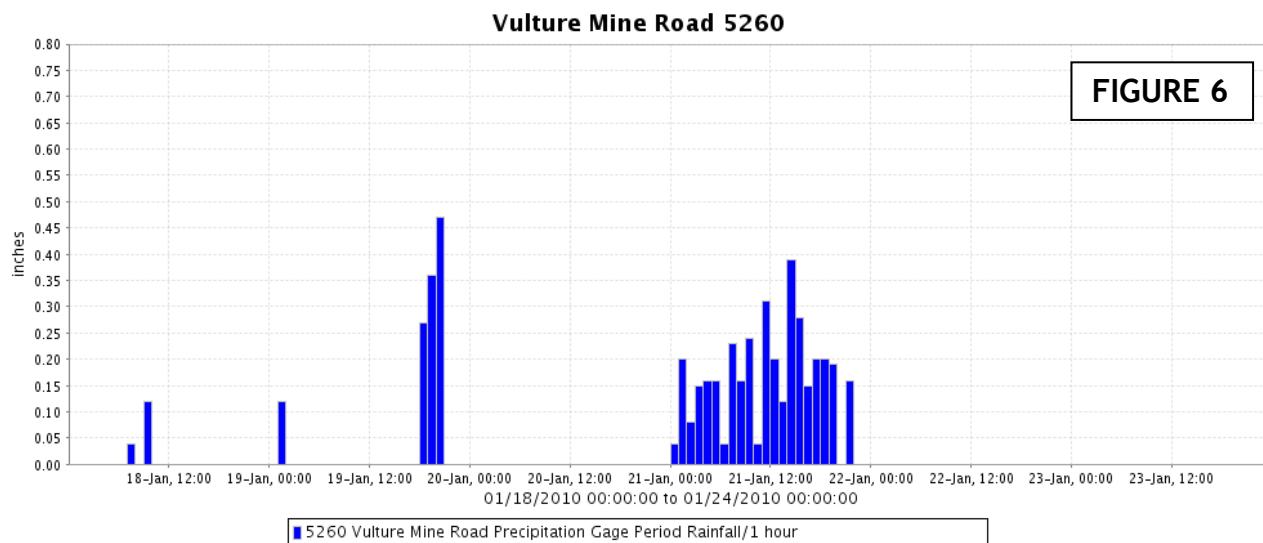

Rainfall amounts for all operational stations during this event are listed in Appendix A. These summaries include 6-hour period totals for January 18<sup>th</sup> through the 23<sup>rd</sup>, plus the peak 6-hour, 12-hour, 1-day, 2-day and 4-day intensities for each gage. These durations were chosen because they coincide with those provided in NOAA Atlas 14. Each column begins with a hyperlink to the gage's history document which includes location information and other meta data.

In Figure 5 above, eight gages are chosen for detailed frequency analysis. These were chosen both to cover many areas of the County, and because they also collected data in January of 1993 - the last "really big" general rainfall event in the ALERT system record. In Tables II-IX below, peak rainfall amounts for durations of 6-hours to 7-days were calculated for this storm, and for the month of January 1993. Return periods in the form of Annual Exceedance Probability were interpolated for the Jan. 2010 durations.

We see from the tables that amounts for this storm were generally greater than those from 1993 in all cases but one - Dreamy Draw Dam in east-central Phoenix. However, only two of the eight stations show truly impressive return periods: Gladden in the northwest County was greater than 80 years for durations of 1-4 days, and Cooks Mesa in the northeast County was greater than 500 years, also for durations of 1-4 days. Here again, orographic lifting is responsible for the larger rainfall amounts.

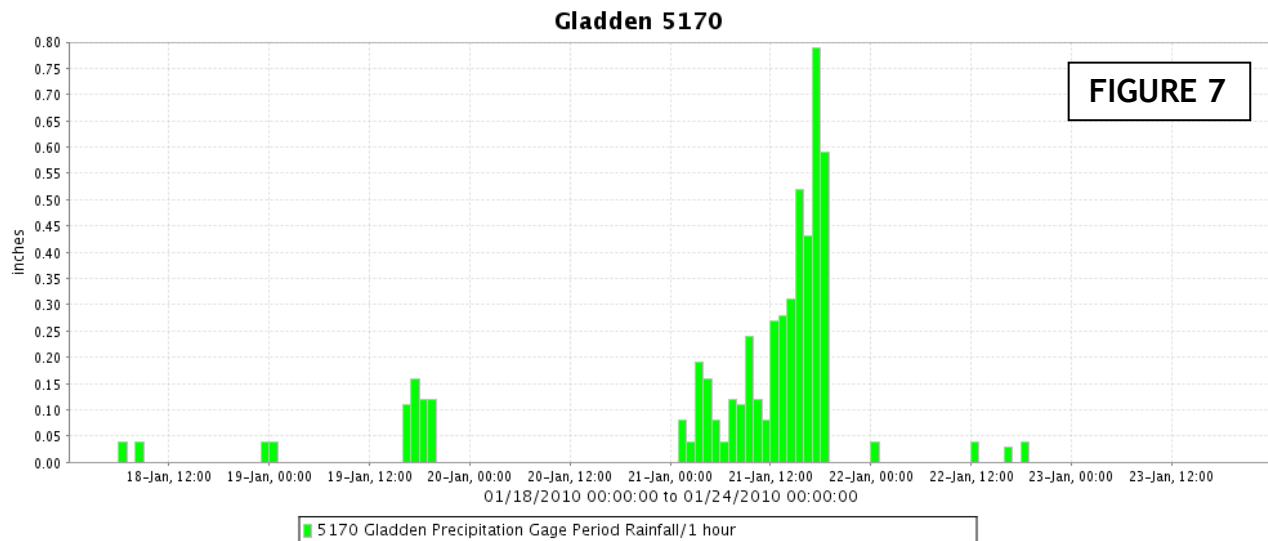

**Table II** below is the [NOAA Atlas 14](#) Point Precipitation Frequency Estimate Table at the latitude/longitude of the [Vulture Mine Road](#) rain gage (5260). The red row lists the recorded rainfall intensities from 01/18-23/2010. The blue row is the interpolated return period in years for each duration. AEP is “Annual Exceedance Probability”. The black row shows a comparison to the rain intensities recorded for each duration in January of 1993.

This section revised Aug. 10, 2010 & Nov. 5, 2010

## RUNOFF

Roughly 91 percent of District streamgages recorded runoff during the event of January 21-22. Flow quantities varied greatly. Locations in the western, northwest, northern, and northeast parts of Maricopa County received the greatest runoff. Gage sites in Pinal County tended to have smaller peak runoff. Some stations received only minor runoff, amounts that would be expected during typical summer monsoonal thunderstorm activity. Stations along Indian Bend Wash and Arizona Canal Diversion Channel were higher than average, but not extraordinary. Flows in the East Maricopa Floodway were in the 1,000 cfs vicinity, which is higher than usual. Stations that did not record runoff were ACDC at 14<sup>th</sup> Street, Estrella Fan, Gila River at Maricopa Road, Pecos Inflow West, Powderhouse Wash, **Pecos Inflow West**, Powerline Floodway, Rawhide Wash, Reata Pass Wash, Sols Tributary at US93, South Mountain Fan, and Tatum Basin Inflow.

The streams of New River and Cave Creek by far experienced the largest flows in many years. The **computed** discharge in Cave Creek (near Cave Creek) is **15,000** cfs which is the largest flow recorded since records began in 1958 and is in excess of a 50-year return period. **The computed discharge at the Cave Creek (4893) gage station was 15,900 cfs at 12.1 feet gage height.** Similarly, the flow on New River (near Rock Springs) is estimated at about 20,700 cfs, which would be the largest flow on New River since data collection began in 1962. **The District's New River Fire (5638) streamgage showed a much less impressive flow (7,500 cfs), and is thought to be too low.**

The Hassayampa River also had high flows. For instance, Hassayampa River at Box Canyon (Box Damsite - USGS) had a peak discharge estimated to be **26,000** cfs, which is the highest since **September 1970** and the **fourth** greatest flow recorded since records began in **1927**. About 21,000 cfs was recorded at the station near Morristown.

Another significant flow occurred on Centennial Wash in two locations. The locations are well removed from one another and the large flow at the lower site is not related to the flow at the upper location. Beginning in the upper watershed, flow at Wenden on Centennial Wash neared seven feet depth, with an estimated discharge of 10,000 cfs. However, due to a significant vegetative obstruction to flow in the channel above the gage, this discharge value is suspect. Much farther downstream and at an earlier time, discharge at the railroad bridge, several miles upstream from the wash's confluence with the Gila River is **computed to be 8,000 cfs at about 14.0 feet gage height. The low chord of the railroad bridge is about 16 feet. This is the largest flow since 1993.**

The heavy rains in northern Maricopa County produced some record flows on smaller streams as well. Skunk Creek (near New River) experienced its highest discharge since installation in 1995. **Discharge was approximately 2,000 cfs. Cline Creek had its highest peak flow since installation in 2001 of 1,225 cfs.**

Other notable discharges include 7,000 cfs at the Hassayampa River at I-10; 5,300 cfs at Skunk Creek at I-17; **4,570** cfs at Jackrabbit Wash above Wickenburg Road; about **3,000** cfs at Seven Springs Wash; 2,400 cfs at Tiger Wash above Eagle Eye Road; **1,600** cfs at Waterman Wash at Rainbow Valley Road; 1,100 cfs in Indian Bend Wash through

Scottsdale; 1,000 cfs at Fourth of July Wash and about 800 cfs each at Cruff Wash and Delaney Wash.

Stations that were not functional during the event were Cave Creek near Cave Creek (4918-vandalism); Colter Channel at El Mirage Road (5408-unknown); Hassayampa River at US60 (5228-construction); IBW at Indian School Road (4618-construction) and Vulture Mine Road (5263-unknown).

NOTE: These discharge values should be considered estimates. Many will be updated as necessary upon verification of peak discharge by field methods. Check our website in July 2010, or the Water Year 2010 Annual Report issued in November 2010.

One record impoundment was recorded during the month at Adobe Dam. Adobe Dam had an impoundment of 16.51 feet, or 1,355.06 feet. Other notable impoundments include Cave Buttes Dam, which reached a level of 1,622.7 feet or 62.7 feet gage height, and New River Dam peaked at nearly 42 feet gage height, or 1,431.4 feet. McMicken Dam had an impoundment for the first time in several years - the level was nearly 3 feet which translates to about 1,500 acre-feet of storage. Sunset FRS and Sunnycove FRS both had impoundments around 22 and 15 percent capacity respectively.

In the southeast valley, Whitlow Ranch Dam had nearly 53 feet of impoundment. Magma FRS and Rittenhouse FRS both had 11-foot impoundments. Tat Momolikot Dam also had about 10 feet of water, which for that structure is a lot of water, but nowhere near its enormous capacity.

Some stations that did not record any impoundment, or insignificant amounts, were Crossroads Park, Freestone Basin, Guadalupe FRS, Phoenix East Park Dam, Phoenix West Park Dam, White Tank FRS #3, and White Tank FRS #4. Only Buckeye #1 FRS was out of service during the event, due to vandalism.

#### TABLE XI - SUMMARY OF SELECTED IMPOUNDMENTS AT FCD STATIONS

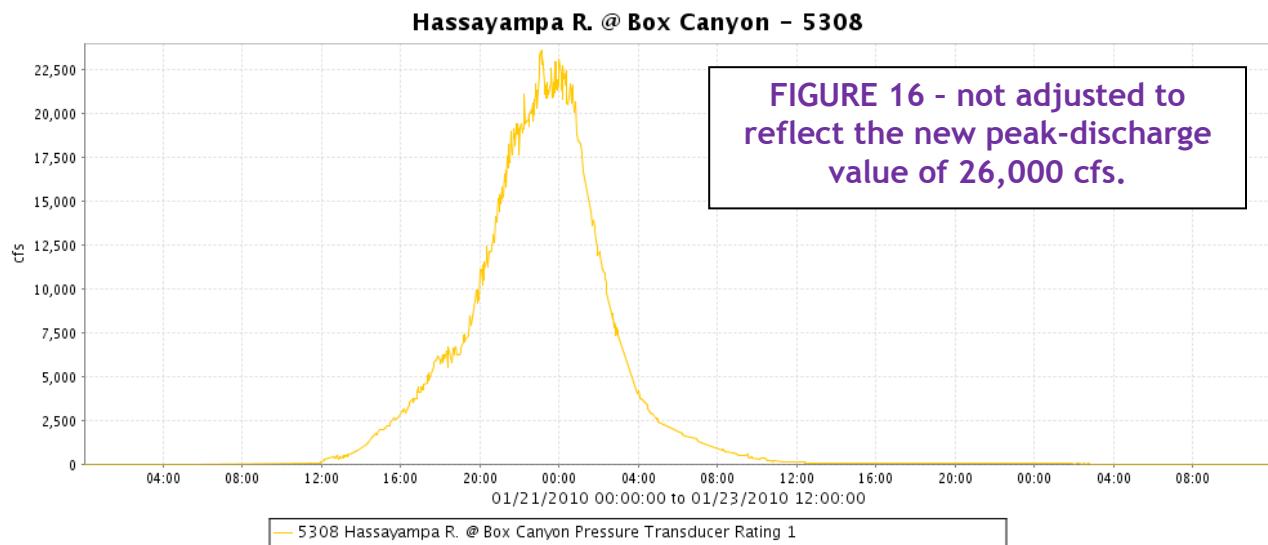

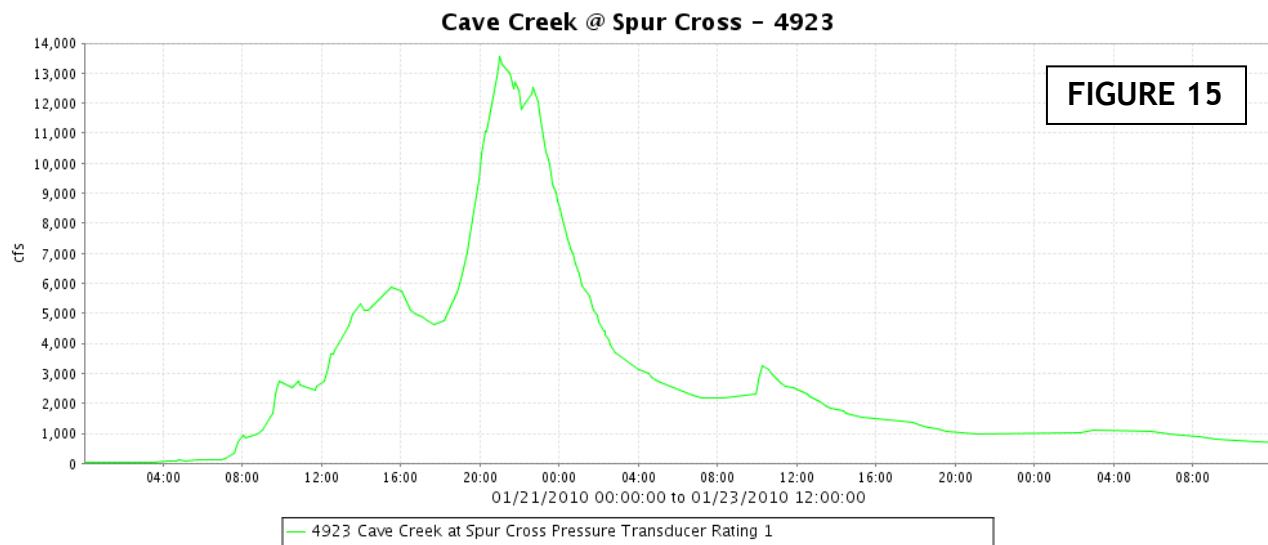

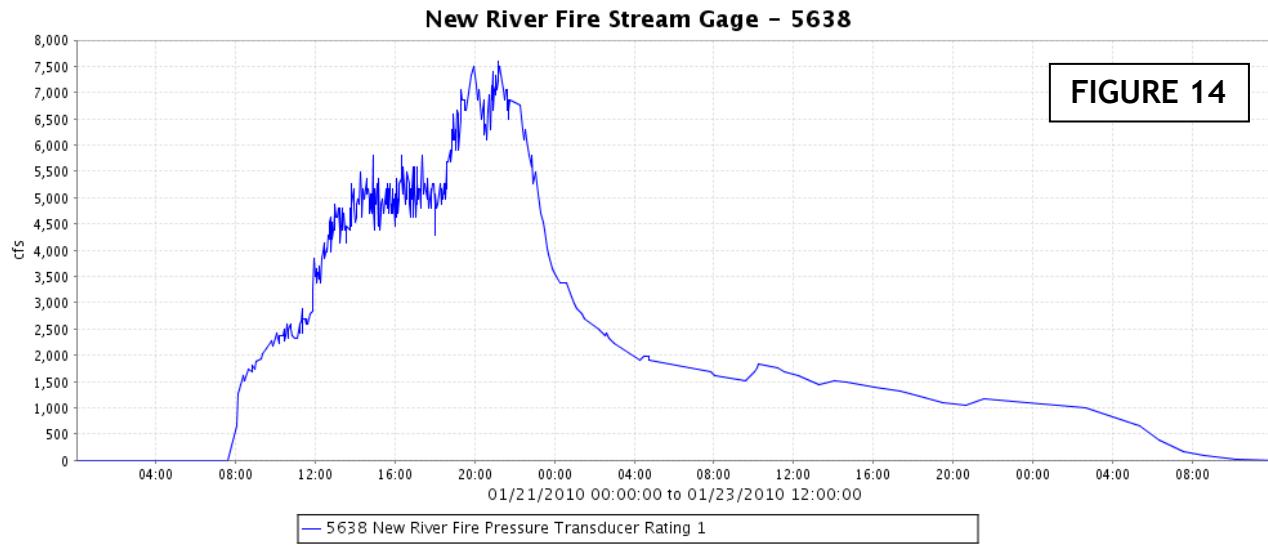

STATION NAME	ID	PEAK Gage Ht. (feet)	PEAK STORAGE (acre-feet)	PEAK CAPACITY (% full)	DATE - TIME

**Acronyms and Abbreviations used in Tables X & XI above:**

ACDC	Arizona Canal Diversion Channel
CAP	Central AZ Project Canal
EMF	East Maricopa Floodway
FRS	Flood Retarding Structure
Gila	Gila River
Hassy	Hassayampa River
IBW	Indian Bend Wash
LAFB	Luke Air Force Base

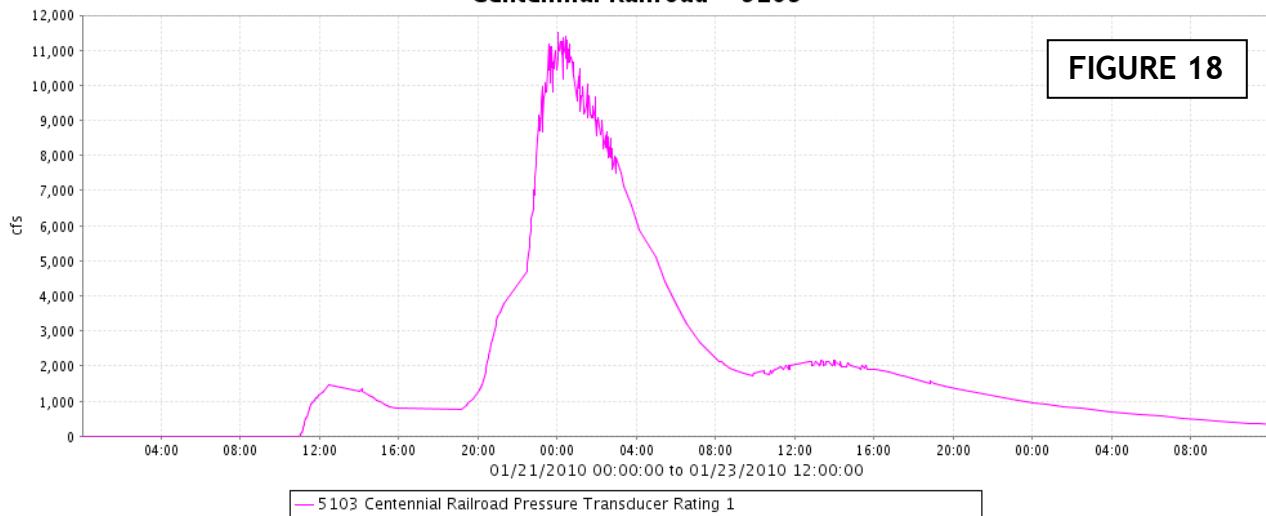

## SELECTED STREAMFLOW HYDROGRAPHS

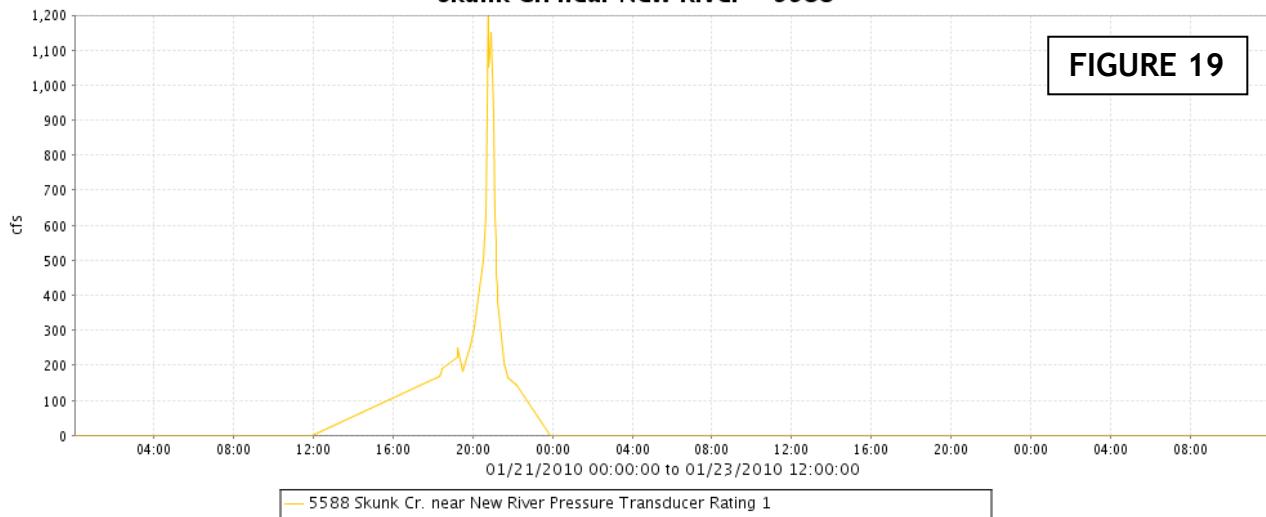

**Centennial Wash @ Wenden – 5093**

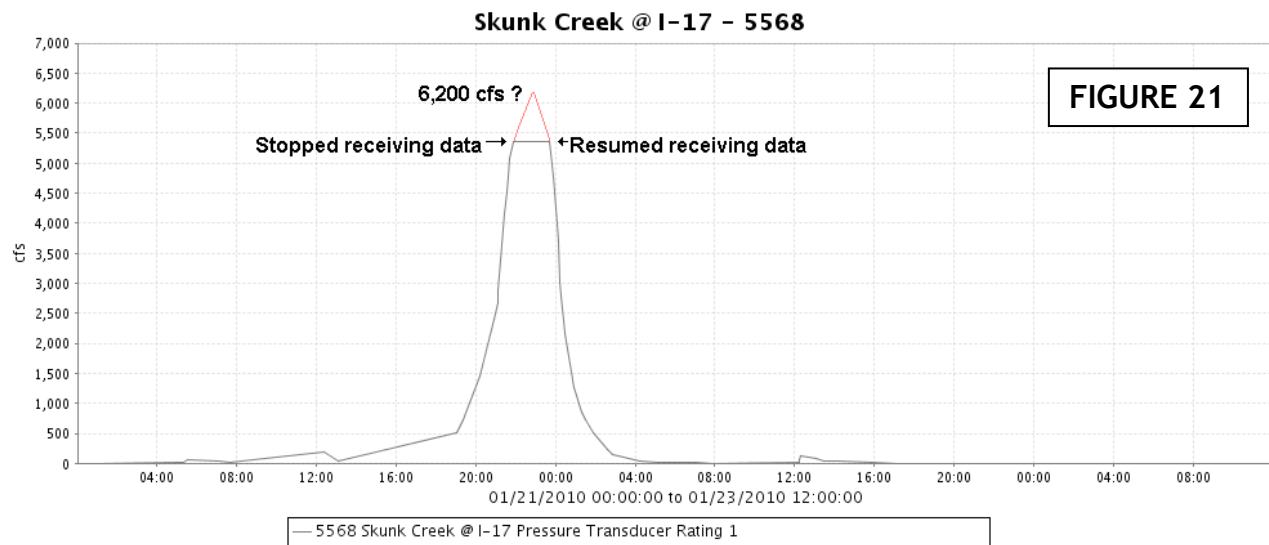

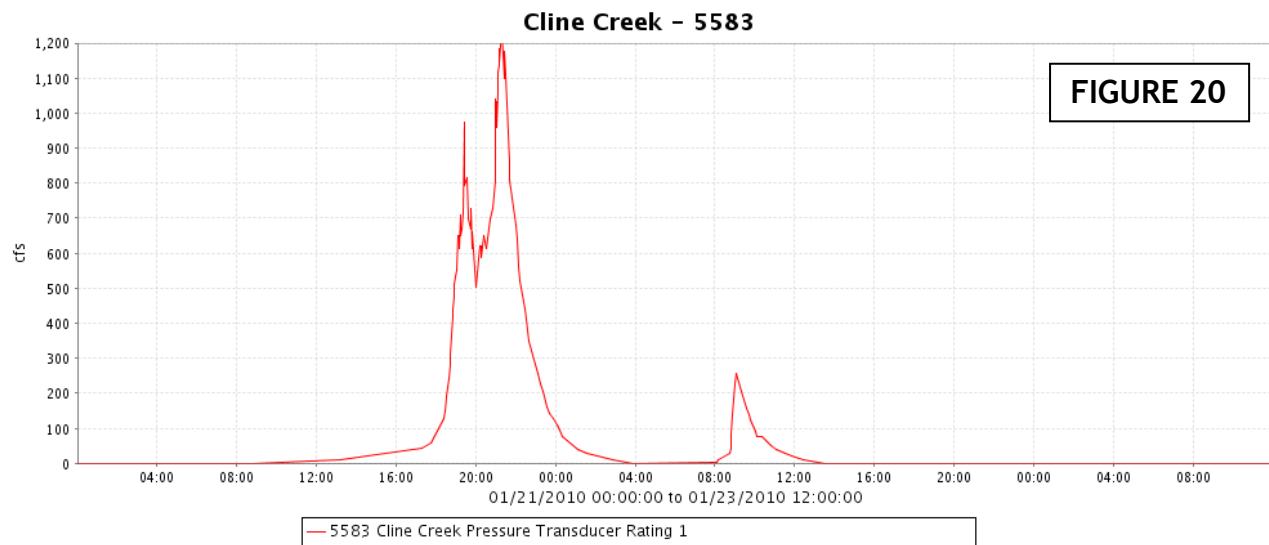

**Centennial Railroad – 5103**

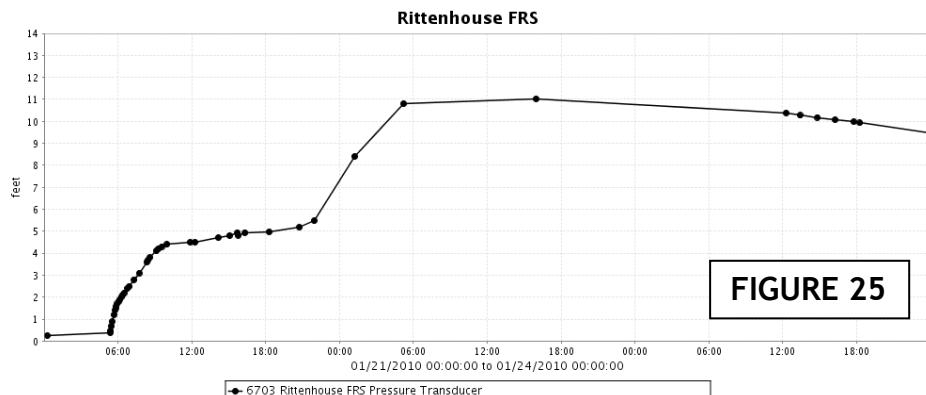

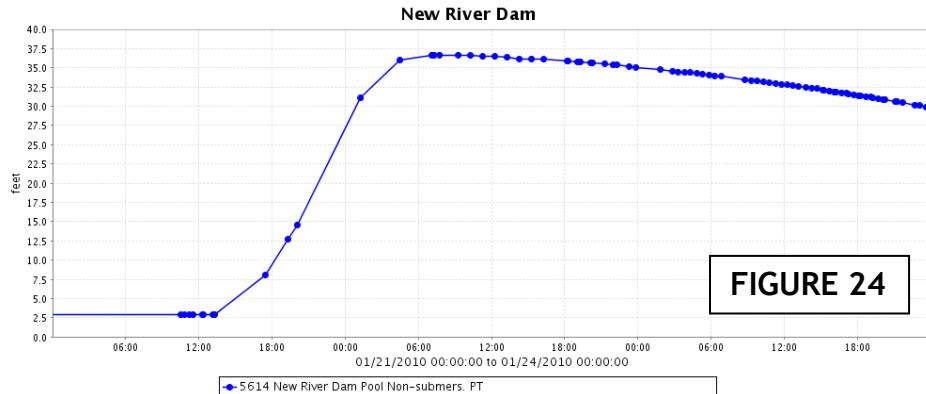

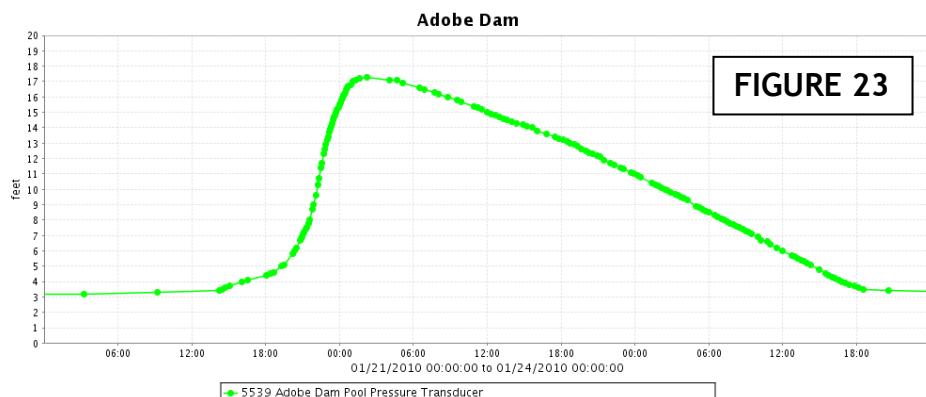

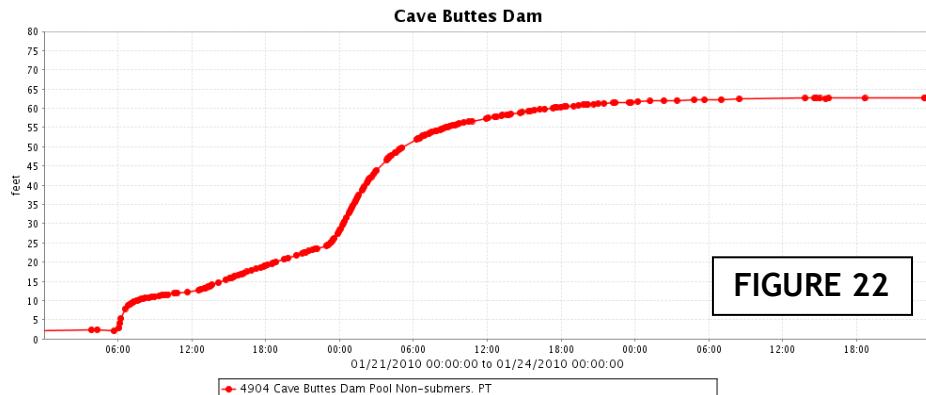

**Skunk Cr. near New River – 5588**

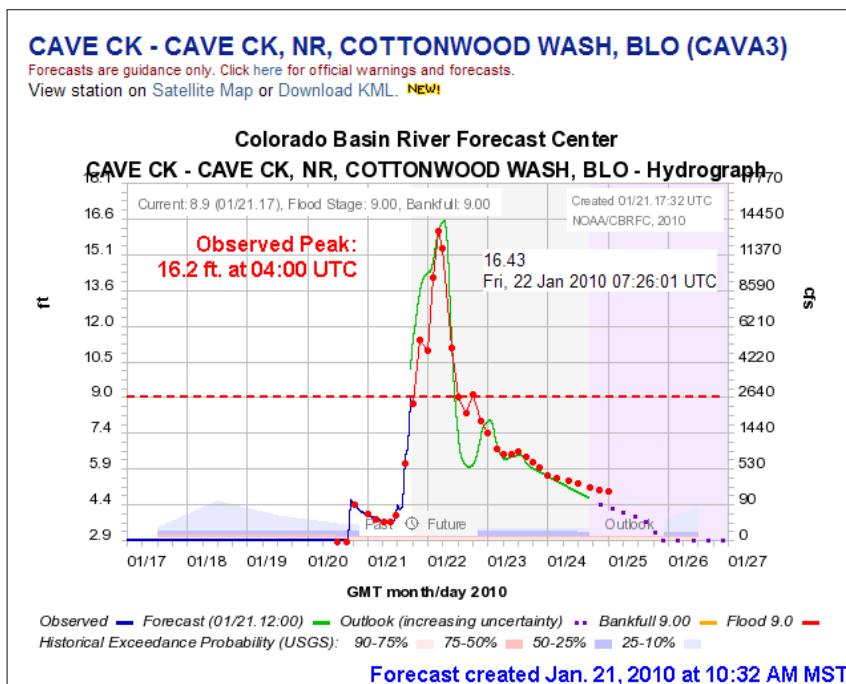

## SELECTED IMPOUNDMENT HYDROGRAPHS

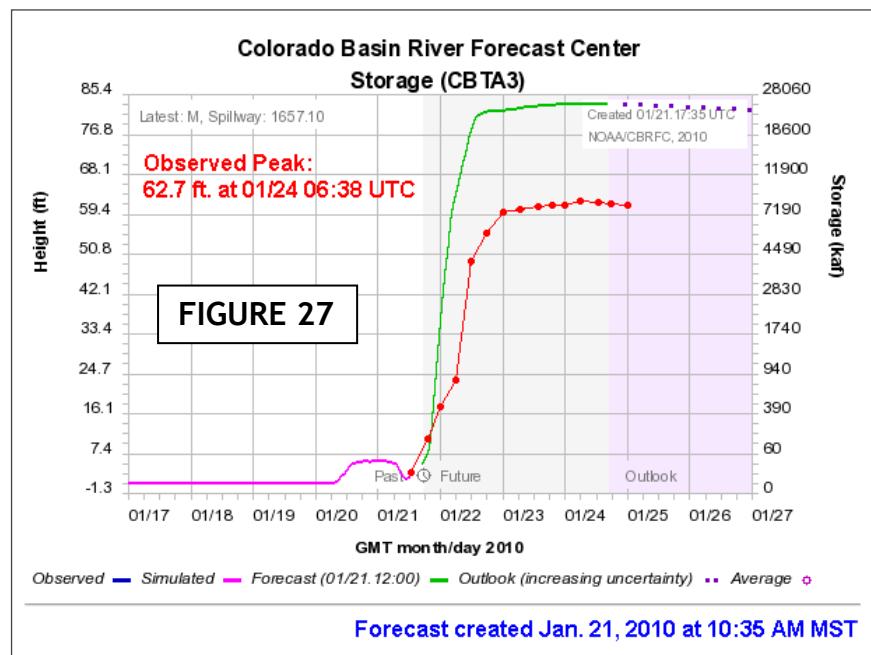

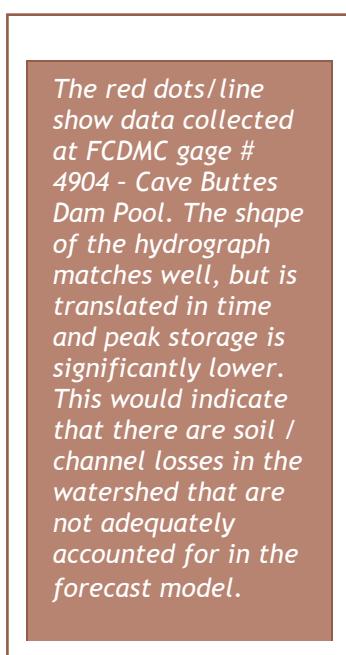

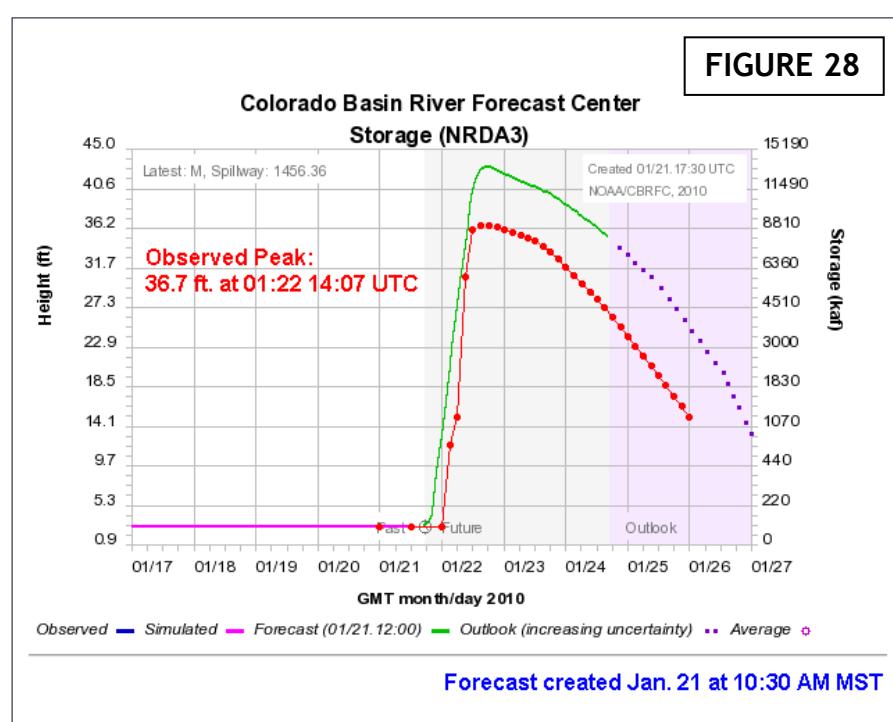

## FLOOD FORECASTS

Flood forecasts are provided to the Flood Control District through a cooperative agreement with the National Weather Services' Colorado Basin River Forecast Center in Salt Lake City. Flood and impoundment forecasts for 50 points in and around Maricopa County are available 24/7 via a [website](#). Data from several key forecast points were downloaded between 10:00 AM and noon on the 21<sup>st</sup> in anticipation of the coming runoff. The forecasts were used to systematize the actions of emergency responders, and in general modeled the peak flows and volumes very well - much better than for the winter event of February 2005.

**FIGURE 26**

The red dots/line show data collected at FCDMC gage # 4923 - Cave Cr. @ Spur Cross. This was an excellent forecast, missing the peak stage by only 0.2 feet and matching the hydrograph shape very well.

**FIGURE 27**

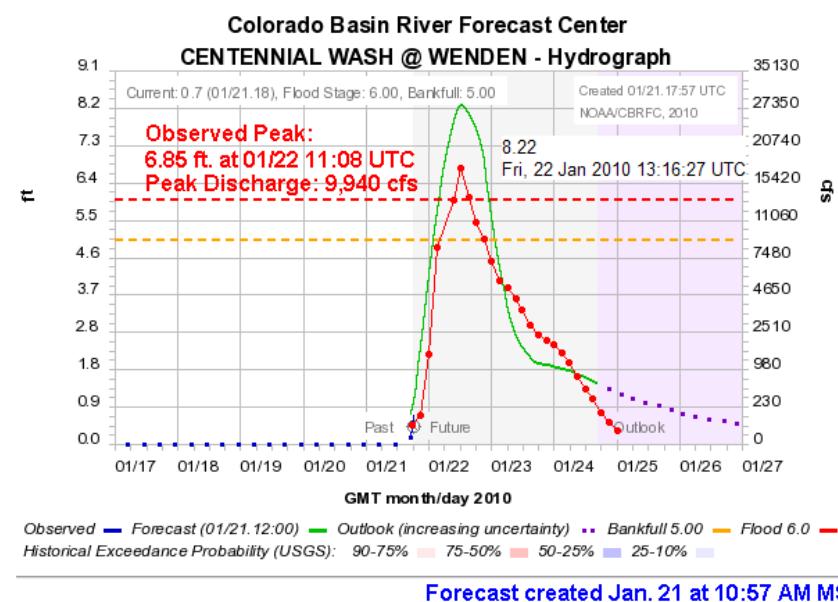

**FIGURE 28**

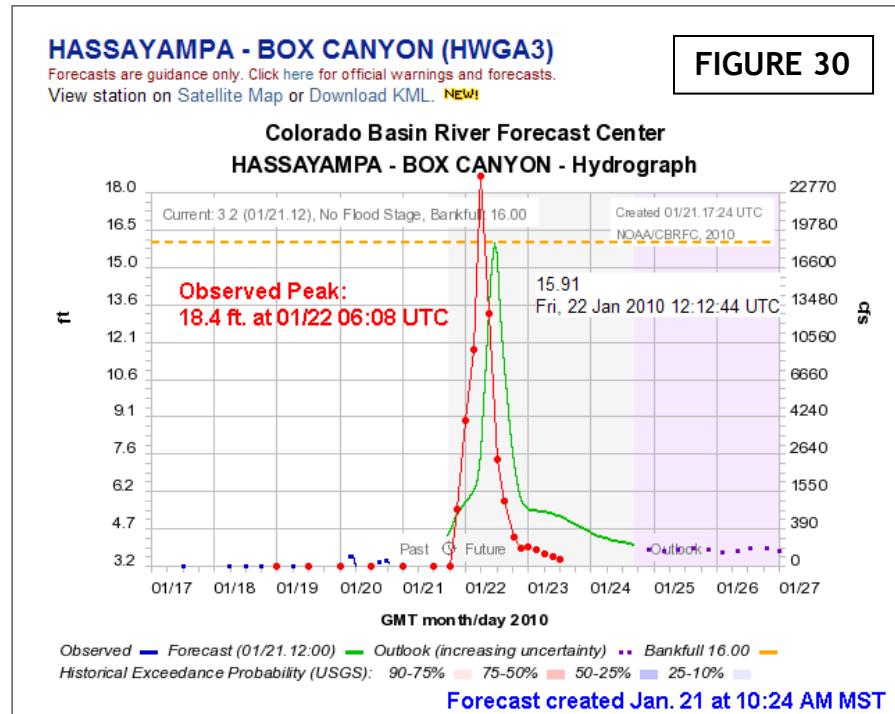

The red dots/ line show data collected at FCDMC gage # 5614 - New River Dam Pool. The shape of the hydrograph matches well, and is slightly translated in time, but the peak storage is significantly lower. This would indicate that there are soil / channel losses in the watershed that are not adequately accounted for in the forecast model. Neither the USGS nor FCDMC gages on New River above the dam provided reliable data during the event.

The red dots/ line show data collected at FCDMC gage # 5093 - Centennial Wash @ Wenden. The general shape is very good, although the peak stage was over-forecast. It also appears that the forecast model is using an incorrect stage/discharge relationship. At 6.85 ft. / 9,940 cfs, the model scale shows a discharge near 18,000 cfs.

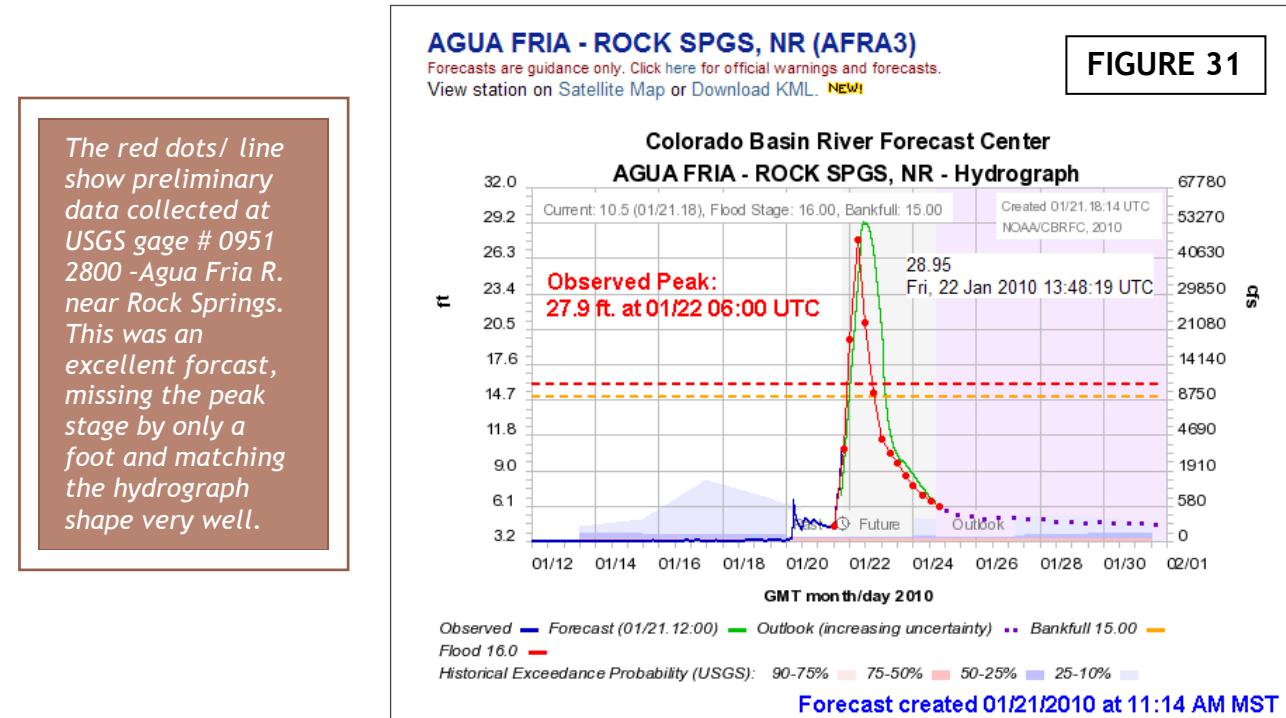

**CENTENNIAL WASH @ WENDEN (CWWA3)**

Forecasts are guidance only. Click here for official warnings and forecasts.  
View station on Satellite Map or Download KML. [NEW!](#)

**FIGURE 29**

**FIGURE 30**

The red dots/ line show data collected at FCDMC gage # 5308 - Hassayampa River @ Box Canyon. The shape of the hydrograph matches well, and is slightly translated in time, but the peak stage is significantly higher. This might indicate that rainfall input estimates for the model were too low.

**FIGURE 31**

The red dots/ line show preliminary data collected at USGS gage # 0951 2800 -Agua Fria R. near Rock Springs. This was an excellent forecast, missing the peak stage by only a foot and matching the hydrograph shape very well.

## FLOOD DAMAGES IN MARICOPA COUNTY

Two ALERT monitoring stations sustained damage on January 21<sup>st</sup>: Mt. Oatman (5000) repeater was blown over during the heavy wind episode, and the stream gage at Cave Creek (4893) was damaged by heavy runoff in Cave Creek.

Below are estimates of damages, supplied by Maricopa County Department of Emergency Management, for a number of jurisdictions within Maricopa County. These estimated damages are preliminary and may be updated in a revision of this report.

Agency	Reimbursement	Amount (\$)
Avondale, City of	Public Assistance 75/25	39,000
El Mirage, City of	Public Assistance 75/25	32,000
Gilbert, Town of	Public Assistance 75/25	67,000
Goodyear, City of	Public Assistance 75/25	338,000
Salt River Project	Public Assistance 75/25	454,000
Surprise, City of	Public Assistance 75/25	83,000
Tempe, City of	Public Assistance 75/25	52,000
Tolleson, City of	Public Assistance 75/25	20,000
	Total:	\$1,085,000

In addition, damages were reported that are not being claimed under Public Assistance due to in-eligibility or because the jurisdiction will absorb the costs in the amount of **\$2,918,000.00**. These include \$1.8 M by the Flood Control District of Maricopa County, \$358K by MCDOT that will not be reimbursed by FHWA, and \$760K by MCDOT that is eligible for reimbursement by FHWA.

5430 - this storm total appears to be low (likely due to high wind exposure), but the gage was visited and no problem was found.

5440 was down from 01/19 23:54 (29) through 01/28 08:52 due to a plugged funnel; this gage has two prior estimates this year; no estimate was made and the record will be considered ineffectual for this year.
