

FLOOD CONTROL  
DISTRICT OF  
MARICOPA COUNTY

**FCDMC ALERT SYSTEM  
ANNUAL SURFACE WATER REPORT**

**WATER YEAR 1994**

**FCDMC ALERT SYSTEM  
ANNUAL SURFACE WATER REPORT**

**WATER YEAR 1994**

## **PREFACE**

This publication presents surface water data collected by the Flood Control District of Maricopa County's automated water level gage network. This telemetered network is located primarily throughout Maricopa County, Arizona with additional gages in Yavapai, Pinal, and La Paz Counties.

The surface water data contained in this report was collected, compiled and edited by the Special Projects Branch of the Hydrology Division. Data includes mean daily, total, maximum, and minimum discharges at 64 flow sites; mean daily, maximum, and minimum pool levels at 23 storage facilities; and mean daily, maximum, and minimum volume stored at 23 storage facilities. Information contained herein is as accurate and complete as possible within the limitations of real-time data collection technology currently available. Wherever possible, footnotes have been included to identify questionable data. Reliance upon the accuracy, reliability, and authority of this information is solely the responsibility of the user.

Additional copies of this report may be purchased from:

**Flood Control District of Maricopa County**  
**2801 W. Durango Street**  
**Phoenix, Arizona 85009**

## TABLE OF CONTENTS

Preface.....	i
Contents.....	ii
Introduction.....	iii
Surface Water Gage Location Map.....	v
List of Stations in alphabetical order.....	vi
Definition of Terms.....	viii
Surface Water Flow Data.....	Tab 1
Pool Levels at Storage Facilities.....	Tab 2
Storage Volumes at Storage Facilities.....	Tab 3

## INTRODUCTION

The Flood Control District of Maricopa County in cooperation with local, state, and federal agencies collects a large amount of data pertaining to surface water runoff in and around Maricopa County. These data provide a valuable resource for information not otherwise furnished by the traditional sources of this type material. To make these data readily available to interested parties outside the Flood Control District, the data are published annually in this report entitled "FCDMC ALERT System Annual Surface Water Report."

This report includes records on discharge at uncontrolled stream gages and at flood control storage structures, on depths at flood control storage structures, and on contents at flood control storage structures. Specifically it contains: (1) Discharge records at 40 uncontrolled stream gages and 24 flood control storage structures; (2) Depths of stored water at 23 flood control storage structures; and (3) Contents at 23 flood control storage structures. Records included are only a small fraction of those obtained for each site during this water year.

This is the first annual surface water report published by the District. Prior to this year, surface water data collected by the FCDMC ALERT System was not quality controlled, and therefore, not published. However, there are data resident in archives prior to this year that may have some value to specific individuals. The FCDMC ALERT System began collecting data as early as 1980.

The data are collected as a depth of flow in feet to the nearest tenth of a foot. The discharge and or contents is then obtained by applying that stage to a rating curve of stage versus discharge in cubic feet per second(cfs), or stage versus contents in acre feet(ac ft). The discharge rating curves have been developed at stream gages by using field surveyed cross sections in a HEC-2 step backwater computer model to obtain a range of stage versus discharge points to be plotted on a curve. The discharge rating curves at flood control storage structures were developed by application of the Federal Highway Administrations HY-8 computer model for culvert flow and US Geological Survey methods for flow over the uncontrolled emergency spillways. The storage rating curves were obtained from published as-built or construction plans or developed from area contour maps.

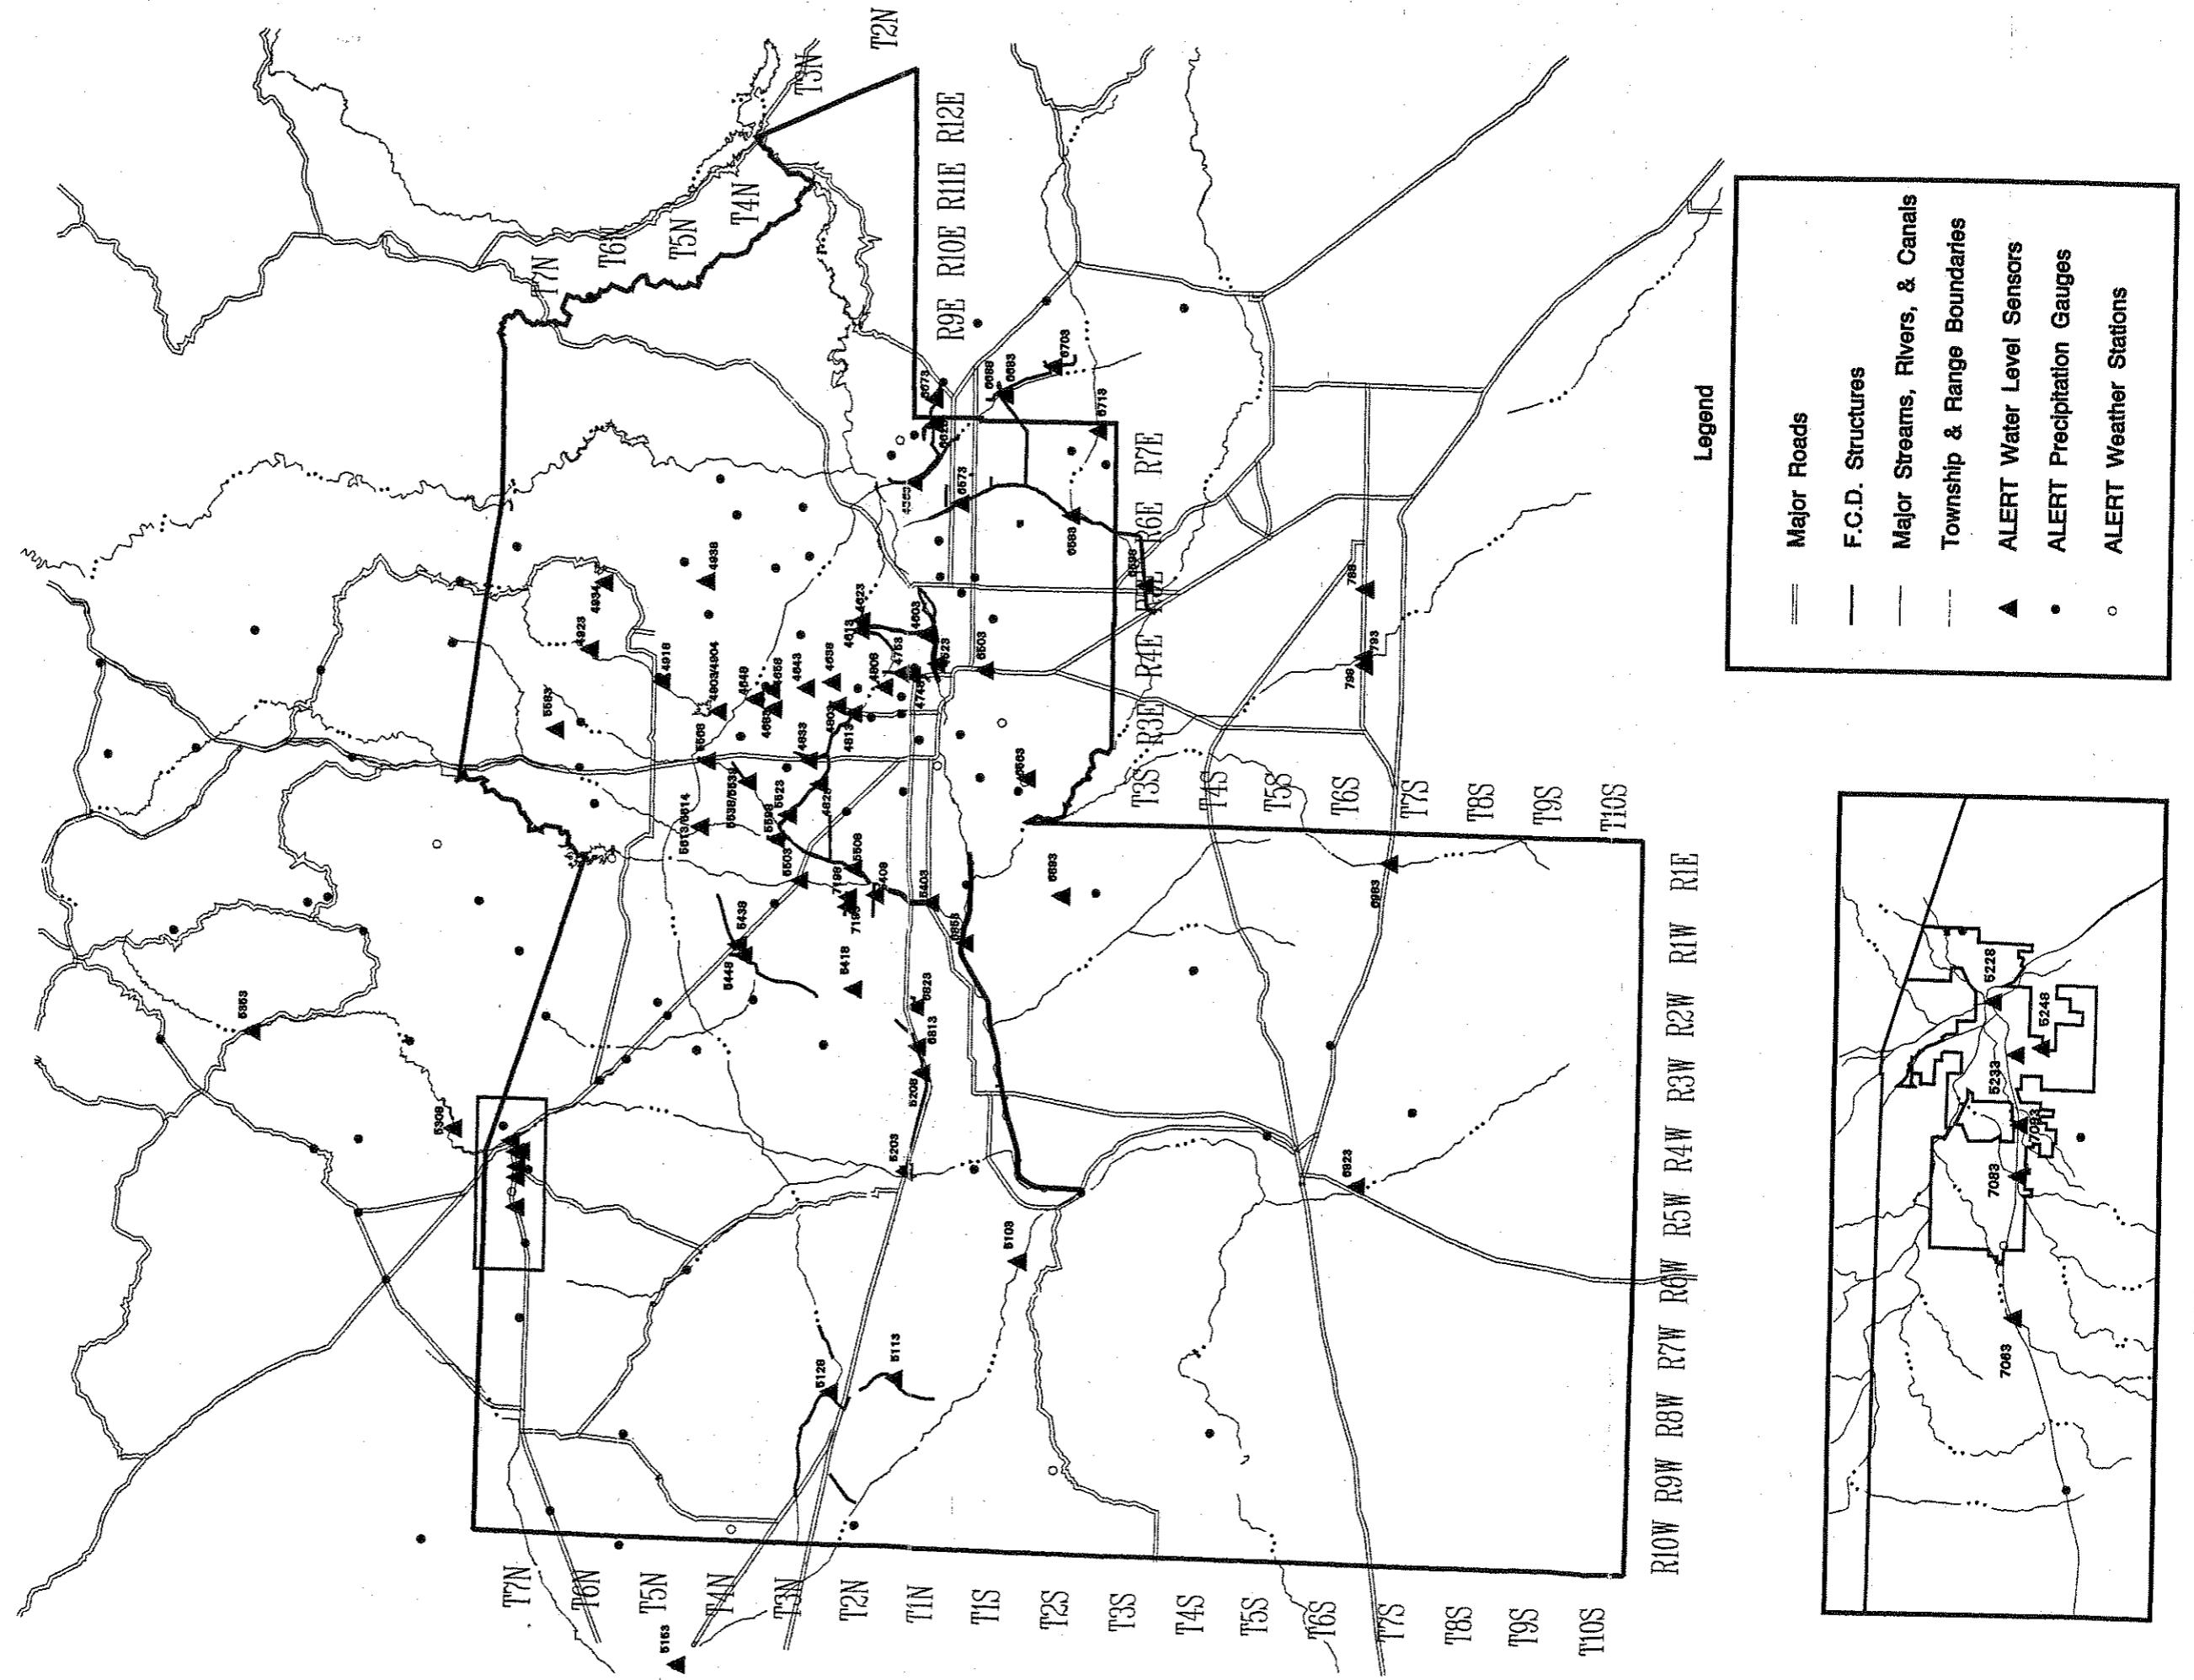

Daily mean discharges are computed by applying the daily mean stages (gage heights) to the stage-discharge curves or tables. The same is similarly true for contents. The minimum and maximum are based on instantaneous readings and the volumes for discharge stations are based on accumulations of daily means. Those gages in section 2, Pool Levels at Storage Facilities, which show a continuous gage height during obvious periods of no storage, do so because the orifice to the pressure transducer is set at that gage height above 0.0' gage datum.

All of the data in this report has been reviewed and edited in an attempt to provide the most accurate data possible. A blank or blanks within the data set is an indication that data was either lost due to hardware, software, or a radio problem, or that the gage had not yet been installed. Where possible, inaccurate data is flagged with a footnote describing the time the gage was down.

An index of gage names, numbers, locations, and other descriptors is included as Table I.

Additional or more detailed surface water data in hard copy or computer disk format is available for the gages listed in this report. Contact the Flood Control District, Hydrology Division, Special Projects Branch at (602) 506-1501.

## DEFINITION OF TERMS

Terms related to streamflow and other hydrologic data, as used in this report are defined below.

Acre-foot (AC-FT) is the quantity of water required to cover 1 acre to a depth of 1 foot and is equivalent to 43,500 cubic feet or about 326,000 gallons or 1,233 cubic meters.

Contents is the volume of water in a reservoir or lake. Unless otherwise indicated, volume is computed on the basis of a level pool and does not include bank storage.

Control designates a feature downstream from the gage that determines the stage-discharge relation at the gage. This feature may be a natural constriction of the channel, an artificial structure, or a uniform cross section over a long reach of the channel.

Control structure as used in this report is a structure on a stream or canal that is used to regulate the flow or stage of the stream.

Cubic foot per second is the rate of discharge representing a volume of 1 cubic foot passing a given point during 1 second and is equivalent to approximately 7.48 gallons per second or 448.8 gallons per minute or 0.02832 cubic meters per second.

Cubic foot per second-day is the volume of water represented by a flow of 1 cubic foot per second for 24 hours. It is equivalent to 86,400 cubic feet, approximately 1.9835 acre-feet, or about 646,000 gallons or 2,445 cubic meters.

Discharge is the volume of water (or more broadly, total fluid plus suspended sediment), that passes a given point within a given period of time.

Mean discharge (MEAN) is the arithmetic mean of individual daily mean discharges during a specific period.

Instantaneous discharge is the discharge at a particular instant of time.

Drainage area of a stream at a specified location is that area, measured in a horizontal plane, enclosed by a topographic divide from which direct surface runoff from precipitation normally drains by gravity into the stream above the specified point.

Drainage basin is a part of the surface of the Earth that is occupied by a drainage system, which consists of a surface stream or body of impounded surface water, together with all tributary surface streams and bodies of impounded surface water.

Gage datum is the elevation of the zero point of the reference gage from which gage height is determined as compared to the National Geodetic Vertical Datum of 1929. This elevation is established by a system of levels from known bench marks or by approximation from topographic maps.

Gage height is the water-surface elevation referred to some arbitrary gage datum. Gage height is often used interchangeably with the more general term "stage," although gage height is more appropriate when used with a reading on a gage.

Gaging station is a particular site on a stream, canal, lake, or reservoir where systematic observations of hydrologic data are obtained.

National Geodetic Vertical Datum of 1929 (NGVD 1929) is a geodetic datum derived from a general adjustment of the first order level nets of both the United States and Canada. It was formerly called "Sea Level Datum of 1929" or "mean sea level." Although the datum was derived from the average sea level over a period of many years at 26 tide stations along the Atlantic, Gulf of Mexico, and Pacific Coasts, it does not necessarily represent local mean sea level at any particular place.

Stage-discharge relation is the relation between gage height (stage) and the volume of water, per unit of time, flowing in a channel.

Streamflow is the discharge that occurs in a natural channel. Although the term "discharge" can be applied to the flow of a canal, the word "streamflow" uniquely describes the discharge in a surface stream course. The term "streamflow" is more general than "runoff" as streamflow may be applied to discharge whether or not it is affected by diversion or regulation.

Water year dealing with surface-water data is the 12-month period, October 1 through September 30. The water year is designated by the calendar year in which it ends and which includes 9 of the 12 months. Thus, the year ending September 30, 1994, is called the "1994 water year."
